

Stats on Tesla Autonomous Car Accidents

11 Tesla self-driving vehicle accidents have been reported in the last four years.

More specifically, they resulted in 17 injuries, and unfortunately, one death. That's why the US Department of Transportation started an investigation into the auto manufacturer Tesla's autopilot system.

Three Tesla drivers have lost their lives in accidents involving Tesla's Autopilot in the last six years.

Autonomous vehicle statistics note that one of those accidents occurred on the California freeway in August 2019. A Tesla Model 3 and a Ford Explorer pick-up crashed.

A father and his teenage son were in the Ford, and unfortunately, the teenage boy was thrown from the vehicle and died. As seen from a video, neither the driver nor the Autopilot slowed the car until a second before the crash.

A Tesla driver died in 2018 when the Model X SUV accelerated and crashed into a safety barrier.

According to his family, Walter Huang, a 38-year-old Apple engineer, didn't think he would be part of self-driving cars crashes and believed that Tesla's self-driving cars were more reliable and safer than regular cars.

It was later discovered that Walter was playing a video game at the time of the accident, so his hands were off the wheel. However, Tesla was criticized for not having a system that monitors driver alertness better.

In 2019, the self-driving Tesla Model S caused a pedestrian fatality in Florida.

This one is also part of the disturbing Tesla autonomous vehicle accidents. Namely, the car driver dropped his phone and bent down to find it. The road was ending, and the vehicle passed a stop sign and a red light. Then, the car hit a parked vehicle, killing a 22-year-old student.

This is another example of how dangerous phones while driving are. Let's not forget that you will spend 400% more time with your eyes off the road if you use a cell phone while behind the wheel.

Another example of self-driving car accidents is Tesla smashing into a parked police car and a Mercedes SUV in 2021.

Tesla was sued for the accident which happened in Florida. When Tesla's cars are in Autopilot mode, they tend to smash into emergency response vehicles. Similarly, A Tesla S in Autopilot crashed into a parked fire truck in Utah in 2018.
